

**Procedures for quarantine of crew**

*Quarantine separates and restricts the movement of people who were exposed to a contagious disease to see if they become sick.*

**If the vessel does not have separate facilities for quarantine, consider the entire vessel under quarantine.**

**If the vessel has separate facilities for quarantine, follow the quarantine procedure:**

- Passengers and crew members who have had **high-risk exposures** to a person suspected of having COVID-19 should be quarantined in their cabins
- All potentially exposed passengers, ship medical staff, and crew members should self-monitor under supervision of ship medical staff or telemedicine providers until 14 days after the last possible exposure.
- If private cabins are not available, a cabin should be designated for the quarantine of exposed individuals.

**If a crewmember is quarantined on-shore**

- Companies should have plans in place for locally housing crew
- Companies should have plans in place for having food and supplies delivered to crew
- Crew **MUST NOT** interact with local populations
- Companies must have plans in place for contact with local governance and medical facilities to ensure crew may be quarantined locally
- Crew must have a plan for 24/7 access to medical care or advice should their condition worsen
- Consider charter flights or medevac transportation to move quarantined workers to areas with more advanced medical capabilities
